HOUSTON-AREA COUPLE GIVES THANKS EARLY THIS YEAR WITH ARRIVAL OF QUINTUPLETS AT THE WOMAN'S HOSPITAL OF TEXAS

HOUSTON, October 31, 2008 – When Bill and Kelly Phillips first met over a game of dominos at Texas A&M, they could never have predicted just how full their lives together would be. The Phillips are giving thanks for five new bundles of joy after Kelly delivered quintuplets at The Woman's Hospital of Texas (Woman's) in Houston this past week.

The quintuplets were delivered via C-section on October 25 by Dr. Brian Kirshon, OB/GYN and Maternal/Fetal Medicine specialist with Houston Perinatal Associates, P.A. – a specialty group at Woman's. Although contractions began at only 18 weeks, Kelly didn't deliver until 33 weeks into her pregnancy – a remarkable accomplishment since the average gestation for quintuplets is 27.4 weeks. In fact, Kelly's pregnancy duration nearly equaled that of the longest gestation for quintuplets on record: the Wilson quint, born at 34.3 weeks.

"When we found out we were having not one but five babies, we were in shock but once we were through the first trimester and started picking names, we were ecstatic," said Kelly Phillips.

Kelly spent her final month of pregnancy at the Antepartum unit at Woman's, even receiving a surprise party from the nurses once she hit her 32nd week — a benchmark for the babies' development. "This has been such an exceptional experience all the way around and the remarkable care and attention we've received from everyone at Woman's has only added to our joy," said Phillips.

With the health of her five babies as her priority throughout the pregnancy, Kelly began limiting her activities and lowering her stress levels once she made it through her first trimester. She followed Dr. Kirshon's instructions to the letter, all the while maintaining the power of positive thinking and prayer to keep her babies safe and strong in utero. The result: John, Becca, Ali, David and Kate ranging in weight from 3 lbs. 3 oz. to 4 lbs. 12 oz. and growing steadily in Woman's Level II Neonatal Intensive Care Unit (NICU).

"It's a tremendous feat for the Phillips' quintuplets to get to 33 weeks gestation and have such exceptional birth weights," said Kirshon. "That is certainly a testament to what a remarkable patient Kelly is and her absolute commitment to her babies' health and well-being."

Bill and Kelly join a very select group of parents with high order multiples. According to the CDC's National Center for Health Statistics, the number of quintuplets and other higher order births in 2005 totaled only 68 nationwide, and in Texas, only 0.1 percent of live births were triplets or larger. Woman's delivers nearly 9,000 babies each year, including a high number of multiples; quintuplets, however, remain a rarity.

--more--

"It's not every day that quints are delivered, but our team has the experience and know how to care for multiples – even high order multiples like these babies," said Dr. Jayne Finkowski, a Neonatologist with Medical Center Neonatal Associates, P.A. – a specialty group at Woman's. "All five are doing exceptionally well and are being cared for in our Level II NICU where we will monitor their progress until they are ready to be released."

While the Phillips may not yet be "Jon & Kate Plus 8," – TLC's hit series – they are well on their way. With an 18-month-old at home, the latest additions to the family expand their kid count to six: three boys and three girls. While it will likely be a tight squeeze in their three bedroom home in The Woodlands, Texas, when they bring the babies home, both parents agree there is more than enough room in their hearts for all of their children. To keep track of the Phillips' family, visit their blog online at Phillipsmultiples.blogspot.com.
